## **AMENDMENTS TO THE SPECIFICATION**

Please replace paragraph 40 with the following paragraph rewritten in amendment format:

As previously discussed, the present invention is not limited to the spiral shape; in alternate embodiments, other tool path algorithms keeping uniform exposure for varied shapes can be used. Also,  $V_{max}$  can be decreased in various ways between successive layers to achieve a desired contour in a finished workpiece. The vertical cross section containing the axis of the hole determines how the  $V_{max}(i)$  is progressed where i is the number of steps for reducing the  $V_{max}$ . A linear function of  $V_{max}(i+1) = V_{max}(i) - \Delta V_{max}$  results in a constant taper with fixed taper angle. Another function of  $V_{max}(i+1) = V_{max}(i) - (\Delta V_{max} * i)$  makes the taper angle less and less steep as radius is reduced progressively steeper. On the other hand,  $V_{max}(i+1) = V_{max}(i) - (\Delta V_{max} / i)$  makes the taper angle progressively steeper less and less steep as radius is reduced. In general, the Vmax(i) needs to be determined by the cross section (or shape) specification.
